Matrix Operations

- ▶ Using Vectorisation
- ▶ Here various matrix operations are performed **without using loops**
- ▶ For this, we can use various functions in the built in package **numpy**

```
# Matrix Addition
```

```
>>> import numpy
>>> matrix1=numpy.matrix([[1,2],[3,4]])
>>> matrix2=numpy.matrix([[4,3],[2,1]])
>>> matrix3=numpy.add(matrix1,matrix2)
>>> print(matrix3)
[[5 5]
 [5 5]]
```

Matrix Operations

```
# Matrix Subtraction
```

```
>>> import numpy
>>> matrix1=numpy.matrix([[2,2],[2,2]])
>>> matrix2=numpy.matrix([[1,1],[1,1]])
>>> matrix3=numpy.subtract(matrix1,matrix2)
>>> print(matrix3)
[[1 1]
 [1 1]]
```

```
# Matrix Multiplication
```

```
>>> import numpy
>>> matrix1=numpy.matrix([[2,2],[2,2]])
>>> matrix2=numpy.matrix([[1,1],[1,1]])
>>> matrix3=numpy.matmul(matrix1,matrix2)
>>> print(matrix3)
[[4 4]
 [4 4]]
```

Matrix Operations

Scalar Multiplication

```
>>> import numpy
>>> matrix1=numpy.matrix([[2,2],[2,2]])
>>> matrix2=2*matrix1
>>> print(matrix2)
[[4 4]
 [4 4]]
```

Matrix Transpose

```
>>> import numpy
>>> matrix1=numpy.matrix([[1,2],[3,4]])
>>> print(matrix1)
[[1 2]
 [3 4]]
>>> matrix2=numpy.transpose(matrix1)
>>> print(matrix2)
[[1 3]
 [2 4]]
```

Matrix Transformations

- ▶ We can use matrices for performing various geometric transformations such as **translation**, **rotation**, **scaling** etc.
- ▶ **Translation** is the process of moving an object to a different position
- ▶ **Rotation** is the process of changing the angle of the object
- ▶ **Scaling** is the process of changing the size of objects

Matrix Transformations

► Translation Matrix

$$\begin{bmatrix} 1 & 0 & T_x \\ 0 & 1 & T_y \\ 0 & 0 & 1 \end{bmatrix}$$

► Program

```
import numpy
def translationMatrix(tx=0, ty=0):
    return numpy.matrix([[1,0,tx],
                          [0,1,ty],
                          [0,0, 1]])
matrix=translationMatrix(1,1)
print(matrix)
```

Matrix Transformations

► Rotation Matrix

$$\begin{bmatrix} \cos\theta & -\sin\theta & 0 \\ \sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

► Program

```
import numpy
def rotationMatrix(degree):
    theta = numpy.radians(degree)
    c,s=numpy.cos(theta),numpy.sin(theta)
    return numpy.matrix([[c, -s, 0],
                          [s,  c, 0],
                          [0,  0, 1]])

matrix=rotationMatrix(30)
print(matrix)
```

Matrix Transformations

► Scaling Matrix

$$\begin{bmatrix} S_x & 0 & 0 \\ 0 & S_y & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

► Program

```
import numpy
def scalingMatrix(sx=0, sy=0):
    return numpy.matrix([[sx,0,0],
                          [0,sy,0],
                          [0, 0,1]])
matrix=scalingMatrix(2,2)
print(matrix)
```

Singular Value Decomposition (SVD)

- ▶ It is the process of decomposing a matrix into 3 components which are also matrices
- ▶ A matrix M is decomposed into 3 matrices U , S and V
- ▶ If M is a real matrix, U and V are orthogonal matrices and S is a diagonal matrix
- ▶ The advantage of such a decomposition is that we can do the subsequent matrix operations faster
- ▶ Applications - solving homogeneous linear equations, pattern recognition, natural language processing, weather prediction, machine learning etc.

Singular Value Decomposition (SVD)

► Program

```
# Imports matrix, matmul and diag functions only
from numpy import matrix
from numpy import matmul
from numpy import diag
# Imports svd fn from linalg(linear algebra) submodule of
# scipy module
from scipy.linalg import svd
# define a matrix
A = matrix([[1, 2, 3], [4, 5, 6], [7, 8, 9]])
print(A)
# Singular-value decomposition
# A is decomposed into 3 matrices U, a diagonal matrix
# and V
# Here S contains only the diagonal elements of the
# diagonal matrix
U, S, V = svd(A)
```

Singular Value Decomposition (SVD)

► Program - continued

```
print(U)
print(S)
print(V)
# create diagonal matrix from diagonal elements
Sigma = diag(S)
print(Sigma)
# reconstruct matrix
B = matmul(U,matmul(Sigma,V))
print(B)
```

Singular Value Decomposition (SVD)

► Output

```
[[1 2 3]
 [4 5 6]
 [7 8 9]]

Histogram

- ▶ Write a program to plot a histogram of marks obtained by students in a class
- ▶ Marks - 22,87,5,43,56,73,55,54,11,20,51,5,79,31,27

```
# imports pyplot, a module used in the package matplotlib
# to plot various figures
from matplotlib import pyplot
# imports array() from numpy package
from numpy import array
# subplots() specify the number of plots in the figure
# first argument is number of rows
# second argument is number of columns
# This function returns a tuple containing figure and axes
# objects
# These objects are assigned to fig and ax
# They are needed for changing figure level and axes level
# attributes
fig,ax = pyplot.subplots(1,1)
```

Histogram

► Program - continued

```
a = array([22,87,5,43,56,73,55,54,11,20,51,5,79,31,27])
# Draws a histogram, first argument is the array of
# numbers, second argument bins are intervals of values
ax.hist(a,bins=[0, 10, 20, 30, 40, 50, 60, 70, 80,90,100])
ax.set_title("histogram of result")
ax.set_xticks([0, 10, 20, 30, 40, 50, 60, 70, 80, 90,100])
ax.set_xlabel('marks')
ax.set_ylabel('no. of students')
# Shows the plot
pyplot.show()
```

Histogram

► Output

Histogram

- ▶ Draw a histogram of petal length in the iris data set
- ▶ Program

```
from matplotlib import pyplot
# imports pandas package, used for data analysis
import pandas
# reads the csv file into a data frame
# A data frame is a table with rows and columns
df = pandas.read_csv('iris.csv')
fig,ax = pyplot.subplots(1,1)
```

Histogram

- ▶ Draw a histogram of petal length in the iris data set
- ▶ Program - continued

```
# plots the histogram of petal length attribute
# By default bins = 10
df['petal.length'].plot(kind='hist', edgecolor="black",
bins=49)
ax.set_title("Histogram")
ax.set_xticks([1.0,1.5,2.0,2.5,3.0,3.5,4.0,4.5,5.0,5.5,
6.0,6.5,7.0])
ax.set_yticks([0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,
17,18,19])
ax.set_xlabel('Petal Length')
pyplot.show()
```

Histogram

► Output

Scatter Plot

- ▶ Write a program to draw a scatterplot that shows the relationship between rollnos and marks of students in a class
- ▶ rollnos = [1,2,3,4,5,6,7,8,9,10,11,12,13,14,15]
- ▶ marks = [22,87,5,43,56,73,55,54,11,20,51,5,79,31,27]

```
from matplotlib import pyplot
rollnos = [1,2,3,4,5,6,7,8,9,10,11,12,13,14,15]
marks = [22,87,5,43,56,73,55,54,11,20,51,5,79,31,27]
fig,ax = pyplot.subplots(1,1)
# Draws a scatterplot, first argument is x axis values,
# second argument is y axis values
ax.scatter(rollnos, marks)
ax.set_title("Scatter Plot")
ax.set_xticks([1,2,3,4,5,6,7,8,9,10,11,12,13,14,15])
ax.set_yticks([25,50,75,100])
ax.set_xlabel('rollnos')
ax.set_ylabel('marks')
pyplot.show()
```

Scatter Plot

► Output

Scatter Plot

- ▶ Write a program to draw a scatterplot that shows the relationship between petal length and petal width in the iris data set
- ▶ Program

```
from matplotlib import pyplot
import pandas
df = pandas.read_csv('iris.csv')
fig, ax = pyplot.subplots(1,1)
# Creates a dictionary of colour values of each species
colors = {'Setosa':'red', 'Versicolor':'green',
'Virginica':'blue'}
```

Scatter Plot

- ▶ Write a program to draw a scatterplot that shows the relationship between petal length and petal width in the iris data set
- ▶ Program - continued

```
# Groups the data based on species values
grouped = df.groupby('species')
# group represents the grouped data frame
# draws the scatter plot for each group
for key, group in grouped:
    group.plot(ax=ax, kind='scatter', x='petal.length',
               y='petal.width', label=key, color=colors[key])
ax.set_title("Scatter Plot")
ax.set_xlabel('Petal Length')
ax.set_ylabel('Petal Width')
pyplot.show()
```

Scatter Plot

► Output
